Setup and Compilation

This project can be compiled through the Eclipse IDE or the command line.

Eclipse
- Download and unzip the submission folder from Canvas or Github
- Import the submission folder into Eclipse as a Java project
- Navigate to "Main.java" within Eclipse and click the Run button. The program will compile and run.

Terminal
- Download and unzip the submission folder from Canvas or Github
- Navigate to the project's /src/ folder through Terminal and enter the following commands to compile and run the project:
  - javac Main.java
  - java Main

Input/Output

All user input for this program takes place through the command line. Instructions for the user will be displayed through the console. The program will interact with and retrieve data from the remote Mongo database that contains user information.
